Assessment Map

Bloom levels: Application · Analysis · Creation | Evidence: Practice / evidence | Validation: Success check

What you will learn	Practice / evidence	Success check
1. APPLICATION Build and run a multi-agent workflow that saves progress.	Start Docker services; run run_hit_demo; complete the UI flow; inspect the checkpoint.	Services are healthy. The workflow pauses for review and saves PublishedCurriculum.
2. ANALYSIS Keep domain, application, and infrastructure code separate.	Run test_architecture_boundaries.py; compare checkpoint files.	Boundary tests pass. You can explain why domain code avoids LangGraph and FastAPI.
3. ANALYSIS Find and fix state overwrites in a multi-node workflow.	Break and restore operator.add; inspect the node audit trail.	You explain the silent overwrite and apply the append-only fix.
4. APPLICATION Keep checkpoints serializable and provider-agnostic.	Inject a non-serializable mock; test provider options with LLM_PROVIDER.	You fix the msgpack TypeError and remove provider-specific options.
5. ANALYSIS Verify that roles protect review actions.	Try a lead-only action as instructor@example.com; run the authorization tests.	HTTP 403 Forbidden is returned and the automated authorization tests pass.
6. CREATION Design a new RubricCalibrator agent and place it in the graph.	Map routing, state inputs, and outputs; document your design.	Your design shows correct placement and state ownership, and is not copied.
